#### **GENERAL CHARACTERISTICS – TECHNICAL SPECIFICATIONS**

The "360" valves represent an essential element for the realisation of systems of various types and for various uses.

- □ Softening single, duplex, or on more columns for domestic industrial or laboratory use.
- Demineralisation and decarbonisation single, duplex, for laboratory and industrial use and for all uses which require water with guaranteed quality characteristics.
- □ Filtration single or duplex for all applications shown above.

The valves are made from materials which guarantee the maximum durability and quality.

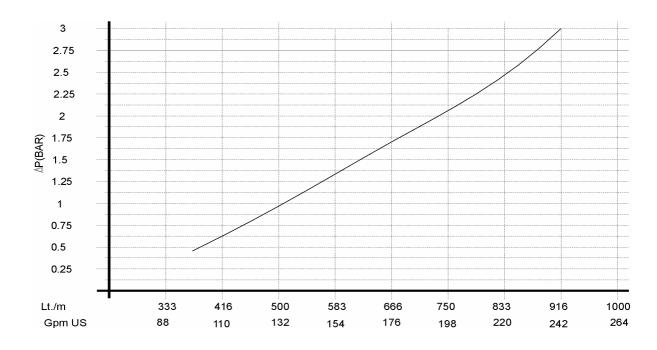

The valves are available with a wide range of timers, for the control of all operative phases of service and regeneration, from the simplest electromechanical timer with a weekly timer, to the sophisticated electronic timers in various models which allow for volume and volume/time controls, controls of salinity in microsiemens/cm etc.

With the electronic systems, all the times of the operative phase operations are programmable, relative to the type and dimensions of the system.

For the specific characteristics of the timers, see the relevant manual.

#### **TECHNICAL SPECIFICATIONS**

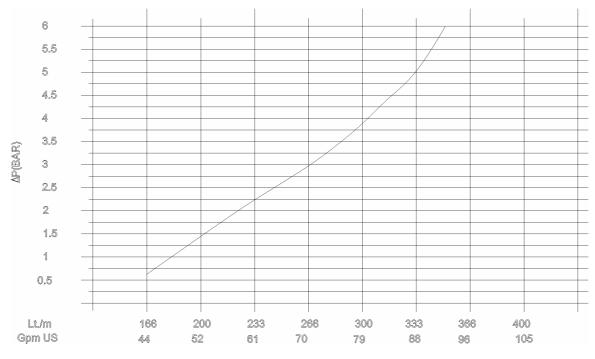

Running pressure	: 2 - 6 bar				
Max. Running load	: 45m <sup>3</sup> /h				
For variables of the value see graph	:-				
Countercurrent rinse load	: max. 12 m <sup>3</sup> /h				
Equicurrent fast rinse load	: 480-1300 l/h				
Equicurrent fast rinse load	: max. 18 m <sup>3</sup> /h				
Static resistance to pressure	: 22 bar				
Max quantity regenerable resin	: 1200 I.				
Running temperature	: 5 - 40° c				
Basic materials of principal components	:abs + fv				
Entry/exit attachments	: 2" female gas

## **USE SPECIFICATIONS**

Referring to the paragraph VERSIONS seen above, the various possibilities for the uses of this valve in the various applications may be examined.

1) Single softening: the system consists of a basic valve V360A-05/05 with or without bypass, and a timer complete with a minimum of 2 external pilots in different solutions, with which the system may be personalised as desired.

In particular, varying the number of external pilots, it is possible to obtain the following personalisations:

- I. **2 pilots** controls only the movement of the pistons of the valve
- II. 3 pilots controls also an additional use closure valve
- III. 4 pilots controls a use closure + a suction closure

**2) duplex softening:** the system is made on two columns, each of which is run by a V360A-05/05 valve. This is controlled, with water or air, by a timer with a minimum of 2 pilots per valve. The alternating duplex systems (one column is in service while the other is in regeneration or not in use), may be controlled by the AQUA CUBIC timer, which may be supplied in two standard versions:

- I. 5 pilots (**AC5-02/05**), run by volume. The system allows for use of two brine valves plus a use closure valve
- II. As a variation on this system, it is possible to substitute the two brine valves with two on-off hidro-pneumatic valves for the closing/opening of the suction duct(see valve V1 page 10), using an AQUA CUBIC 7-pilot timer. (AC7-02/05)

**3) Demineralisation and Decarbonisation:** this is the applicative sector in which the characteristics of the V360 valve may be best appreciated in the models V360D-04/05 & V360D-05/05. The timer predisposed for demineralisation is electronic with external pilots, capable of controlling an anionic and cationic column, can control the level of conductibility showing a valve in µsiemens/cm at the exit of the system, and regenerate the system automatically. The number of pilots of the timer is determined by the type of system required

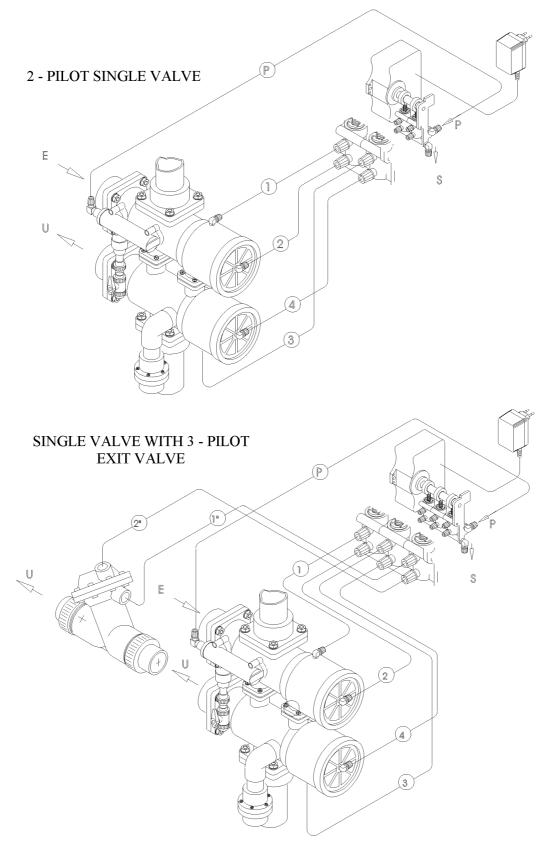

- I. **AQUA IONIC** 5 pilots ( **AI5-02/05** ) controls the two columns + an on-off hydropneumatic use closure valve
- II. **AQUA IONIC** 7 pilots ( **AI7-02/05** ) controls the two columns+ an on-off hydropneumatic use closure valve+ two on-off hydro-pneumatic valves for the closing/opening of the regenerator suction.

**4) Filtration:** the considerations made regarding softening are valid both for single and duplex systems, with the exception that in this case the suction of the regenerator does not need to be controlled.

. For further details regarding the timers, see the *table of timer choice* (page 23).

FLOW CONTROL V360 PREVIEW

INTRODUCTION:

TAKING INTO ACCOUNT A LOAD IN COUNTERCURRENT, FOR CATIONIC RESINS, OF 10Me./h/Mq., AND FOR STRONG ANIONIC RESINS 0F 6Me./h/Mq., IT IS POSSIBLE TO CHOOSE THE APPROPRIATE FLOW CONTROLS FROM THE FOLLOWING TABLE:

NOTE: THE FLOW CONTROLS SPECIFIED BELOW COVER A CYLINDER RANGE FROM 700mm A 2000 mm. FOR CATIONIC AND ANIONIC COLUMNS.

		VOLUME CONTROLLED							
N REGULATOR	CODE REGULATOR	Lt./h	Lt./m.p.	US Gpm	UK Gpm				
2 X C	)70/4	2000	33.3	8.8	7.3				
4 X C	)70/4	3900	65	17	14.3				
5 X 070/4		4900	81.6	21.5	18				
8 X 070/4		7800	130	34	28.6				
9 X C	9 X 070/5		180	47.5	39.6				
13 X 070/5		15500	258	68	56				
15 X 070/5		18000	300	79	66				
19 X 070/5		23000	383	101	84

## NORMAL MAINTENANCE OPERATIONS

Problem	Cause	Corrective action							
<ol> <li>Drain leaking while in service or on stand-by</li> </ol>	Pilot leakage	Disconnect alternately connections 2 and 4, see page 15. If water is leaking from one of the two pressure connections, this means that the relative pilot has leaks and should be replaced. If the leakage does not come from the pilot, the cause should be sought, possibly originating from the head of the V360 piston.							
	Valve leakage through the piston system	<ol> <li>Disconnect one by one the connections 1 and 3, see page 15, if the leaking stops, inspect and if necessary replace the OR of the plastic screw or the piston if it is ridged</li> <li>Check that the pistons and following Or are undamaged and replace them:         <ul> <li>a) First OR after the plastic screw for A/C pos. 3</li> <li>b) Second OR after the plastic screw for B/C pos. 5</li> </ul> </li> </ol>							
2) Assembly and disassembly of 2 chambers		<ul> <li>For all the operations regarding the inside of chambers A/C and B/C the following procedure should be respected:</li> <li>A. Turn off the entry water</li> <li>B. Disconnect the control pipes of the piston movement</li> <li>C. Remove the seeger ring from the stopper, using a suitable tool</li> <li>D. Remove the stopper or the relative OR</li> <li>E. Extract the piston pressing on the internal pin; if it is difficult to extract, loosen the back flange, to allow air to enter without depressing the piston chamber</li> <li>F. Remove the ring-nut holding seeger ring</li> <li>G. Remove the plastic screw and the whole set of distancers and Ors taking care to reinsert them in the upended piston so as not to lose the correct consequence</li> <li>H. Check that the inside of the chamber is undamaged</li> <li>I. Reassemble everything, paying attention to the following:</li> <li>1) Check that the piston is not scratched and above all that the two DE of the head are undamaged and positioned correctly (not upended) see PART. 1</li> <li>2) Check that the two seeger rings are not too out of the shape and when the seeger is reinserted check that the tool used to insert the seeger is used to support the expansion of the ring into its position. The seeger stopper should be replaced every time maintenance is carried out.</li> </ul>							
Hardness leak at exit	Probable leak between entry and exit or on ac/bc seal	Take the piston out of the entry, checking that there is no damage to the surface. If the piston is damaged, replace it. Otherwise, replace the Ors (pos. 1 and pos. 2) of the entry chamber. To carry out this operation, proceed as indicated in point 2, paragraphs "a,b,c,d,e,f".							
Suction failure	Injector	<ul> <li>Disconnect the injector pipe between the injector and the brine. In case of air suction, the reason of a suction failure have to be searched in the measurement system of the brine valve.</li> <li>In case the injector does not suck verify if: <ul> <li>(a) The filter inside the injector body is obstructed</li> <li>(b) The internal OR are defective or the two injector body are defective (in that case we suggest to contact SIATA)</li> <li>(c) The drain conditions do not match with the choosen injector</li> </ul> </li> </ul>
